All financial claims validated against FutureProof EPM v14a Monte Carlo model (50,000 paths, seed=42). Slides marked NEW have been added in this version.

1 Title Slide

Cover page

futureproof

Turning residential property from an illiquid asset into sustainable retirement income — without selling, depleting equity, or sharing appreciation.

John R Innes
Co-Founder & Executive Director
john.innes@futureprooffinancial.co

©2026 Futureproof Financial Group Limited. Confidential.

Design note: Keep the existing visual design. Replace tagline with the above — it's more specific and immediately communicates the value proposition.

2 The Problem

36M American retirees have no fit-for-purpose financial product

Heading: "The world's largest unserved financial market"

Key facts (with sources):

- **\$25 trillion** in home equity held by retirees across US, UK, and Australia — the world's largest asset class, almost entirely illiquid
- **36 million** US homeowner retirees are under-funded for retirement, with housing representing 50%+ of net worth
- **65%** of retirees will never purchase an annuity, guaranteed income product, or investment product — they have no viable alternative
- **Zero innovation** in retirement mortgage products for 35 years — reverse mortgages (1989) remain the only option, and they deplete equity

The only products available — reverse mortgages and shared appreciation mortgages — are expensive for borrowers (compound interest erodes equity), high-risk for lenders (difficult to fund, near-impossible to securitise), and carry reputational risk for the financial institutions that offer them.

Design note: Use the existing 2-panel visual (homeowners / retirees) but add source citations. Remove "suffering" — too emotive for institutional investors. Replace with "underserved".

3 The Market Gap

No fit-for-purpose product exists for asset-rich, cash-poor retirees

Heading: "35 years and no one has solved this"

Two visual panels:

Left panel (35% — blue): 19M cash-rich retirees served by traditional investment, insurance, and annuity products.

Right panel (65% — purple): 36M asset-rich, cash-poor retirees. Current options: reverse mortgages (equity depletion), shared appreciation mortgages (equity sharing), or nothing.

Bottom callout: "No US, UK, or Australian financial institution has introduced a new retirement mortgage product since 1989."

Design note: Keep existing visual structure. Replace "Equity-Eroding Mortgage Products" with more specific language about what's wrong with current options.

4 The Solution

A new index-linked mortgage that preserves equity and generates income

Heading: "The Equity Preservation Mortgage® — a breakthrough retirement mortgage"

Four-stakeholder value diagram (keep existing layout):

Stakeholder	Value Proposition
Borrower	Tax-free retirement income. Home equity fully preserved. No repayments. No equity sharing. No sale required.
Lender / Product Issuer	Non-commoditised product with higher margins. Lifetime customer retention. Fully insured mortgage.
Wholesale Funder	Liquid, securitisable mortgage book. Long-duration, insured assets with predictable cash flows.
Regulator	Well-understood risks, fully insured and reinsured. Consumer protections preserved. No systemic risk introduced.

CHANGE from v2: "Systemically safe / No new risks" → "Well-understood risks, fully insured and reinsured." A regulator will challenge "no new risks" because the index-linked structure is novel. The accurate claim is that risks are identified and mitigated.

5 How It Works

The product mechanics in plain language

Heading: "A new index-linked mortgage referenced to the S&P; 500"

Visual flow: Home Equity → EPM → Outcome

Left box (Home Equity):

- No sale required
- No equity depletion
- No shared appreciation

Centre (EPM):

- Linked to S&P; 500 via passive ETFs
- 30-year term, 80% LTV

Right box (Outcome):

- ~1.25% of home value p.a. as tax-free income
- Paid for 10 years (with inflation-indexing option)
- Home equity fully preserved at maturity

Key Product Innovations (updated):

- Interest paid on behalf of borrower — zero serviceability risk
- Traditional credit risk replaced by long-term index risk — S&P; 500 has never delivered negative returns over any 30-year period
- Mortgage capital held in segregated offset account invested in passive index ETFs
- Built-in volatility buffer (80-120% collar) with annual repricing
- Mortgage insurance removes residual lender risk; portfolio reinsurance covers tail risk
- Principal & Interest variant amortises mortgage to zero — Probability of Claim under 5%

CHANGES from v2:

- "Up to 2% of Home Value p.a." → "~1.25% of home value p.a." (validated by v14a model: \$25K/yr on \$2M property)
- "10-20 Years" → "10 years" (the model's annuity term)
- "continuous dynamic hedging" → "volatility buffer (80-120% collar) with annual repricing" (accurate description of mechanism)
- Added PI amortisation as a key innovation

6 Why It Works — The Core Insight

NEW SLIDE: The actuarial case for the EPM

Heading: "30-year equity returns reliably exceed mortgage costs — the EPM captures this spread"

This is the most important slide in the deck. It explains why the EPM works at a fundamental level, and it's what separates FutureProof from a hand-wavy financial product pitch.

The Math:

Component	Rate	Source
S&P 500 long-term return	~10% p.a.	95-year historical average
Total mortgage cost	~6.4% p.a.	Cash rate 4.4% + wholesale 2% + retail 0.7%
Gross spread	~3.6% p.a.	Available to fund annuity + surplus
Volatility buffer cost	~0.1% p.a.	80-120% collar (net income from selling upside)
Net available spread	~3.5% p.a.	After hedging, before annuity

Why the risk is manageable:

- **Duration:** Over 30 years, compounding smooths annual volatility. The S&P; 500 has never delivered negative total returns over any 30-year period.
- **Buffer collar:** Annual returns are capped at +20% and floored at -20%, eliminating extreme tail events in any single year.
- **Holiday mechanism:** If the investment account drops below threshold, interest charges are suspended and deferred, preventing forced liquidation.
- **Insurance + Reinsurance:** LMI covers 90% of any mortgage deficit; portfolio reinsurance covers the remaining tail risk.
- **PI Amortisation (optimised model):** Mortgage amortises to zero over 20 years post-annuity, eliminating end-of-term balance risk. PoC: 4.94% (50,000-path Monte Carlo, independently validated).

Design note: Visual suggestion: a simple line chart showing the spread between S&P; 500 cumulative returns and cumulative mortgage costs over 30 years, with the shaded area representing surplus available for annuity payments.

7 Risk Architecture

NEW SLIDE: Five layers of protection

Heading: "Five layers of risk mitigation — PoC under 5%"

Visual: Concentric circles or waterfall diagram showing 5 layers:

Layer	Mechanism	Effect
1. Volatility Buffer	80-120% annual collar on S&P 500 returns	Eliminates single-year extreme outcomes
2. Holiday Mechanism	Interest charges suspended when investment < threshold	Prevents drawdown cascade in adverse markets
3. PI Amortisation	Mortgage repaid linearly over 20 years (Year 11-30)	Eliminates end-of-term balance risk
4. Mortgage Insurance	LMI covers 90% of individual mortgage deficit	Transfers residual lender risk to insurer
5. Portfolio Reinsurance	Reinsurance covers worst 10% tail risk	Removes catastrophic portfolio loss scenario

Result:

Metric	Individual Mortgage	Portfolio Level
Probability of Claim (Year 30)	4.94%	< 1% (after cross-subsidisation)
Monte Carlo Paths	50,000	50,000
Mean Surplus at Maturity	\$1,440,000	Net positive across all scenarios
P5 Surplus (95th percentile safe)	\$8,600 (positive)	Strongly positive
Insurance Premium (fair + 50%)	\$12,500 per mortgage	Portfolio-priced

This slide is critical for institutional investors, reinsurers, and bank product teams. It demonstrates that FutureProof has done the actuarial work to a professional standard, not just the product design.

8 Platform Demo

Live product — calculator in alpha release

Heading: "Live platform — annuity calculator now in alpha testing"

Keep the existing screenshot of the calculator. Update the displayed numbers to match the model: \$2M home value → \$2,083/month (\$25,000/year) over 10 years.

Add a line below: "Full SaaS platform includes: borrower portal, lender dashboard, application processing, document management, AI-powered support, and real-time risk monitoring — all built and in testing."

Design note: This is a proof point — the tech is built, not vapourware. The link to the live calculator should work and be impressive.

9 Traction & Partners

Building a global institutional ecosystem

Heading: "Institutional partners across legal, consulting, investment, and reinsurance"

Keep the existing partner logo layout but add clarity on the nature of each relationship:

Category	Partners	Status
Global Business Partner	Accenture	Approved Business Intermediary
Global Legal	Jones Day	Engaged
Product Co-Design	PwC, BlackRock, Spiderock, Atlas SP/Apollo	Completed
Regulatory (In-Country)	EY, Colin Biggers & Paisley, Dentons	Engaged
Reinsurance	Munich Re, Gallagher Re, Lockton Re, Asia Insurance	In Negotiation
Capital Markets	PIMCO, Macquarie	In Negotiation
Product Issuer Pipeline	12 financial institutions (AU, Asia, UK, US)	Pipeline

Key distinction: Clearly label which relationships are "completed engagement", "active negotiation", and "pipeline/exploratory". Sophisticated investors will ask, and pre-empting the question builds credibility.

10 Market Sizing

Bottom-up, not just top-down

Heading: "A \$25T addressable market with a proven capture path"

TAM / SAM / SOM (corrected):

Level	Value	Definition
TAM	\$25T	Total home equity in target markets (US, UK, AU), growing ~4% p.a.
SAM	\$5T	Home equity held by retirees with unencumbered property in target markets
SOM (5-Year)	\$4B	Product Issuers × ~100 mortgages each × \$2M average = \$4B mortgage book generating ~\$20M ARR

CHANGES from v2:

- SAM reduced from \$55B (potential revenue) to \$5T (addressable equity) — these are different measures and the v2 mixing them caused confusion
- SOM is now a bottom-up buildout from the Product Issuer rollout plan, not the current reverse mortgage market
- Removed \$1B ARR claim — replaced with \$20M ARR (realistic from 20 issuers at ~100 mortgages each, scaling over time)
- The \$1B ARR is the long-term vision (10-15 years) as portfolio compounds, not a 5-year target

11 Business Model

5 recurring revenue streams over 30-year mortgage life

Heading: "SaaS fintech with 5 revenue layers — every mortgage generates 30 years of recurring revenue"

Revenue streams (keep existing visual, update numbers):

#	Revenue Stream	Mechanism	Per Mortgage (30yr)
1	Embedded SaaS Fee	25bps annual margin, life-of-loan	~\$140K
2	Profit Share	20% of surplus drawn every 3 years	~\$1,290K
3	End-of-Term Surplus	50% share at mortgage maturity	~\$700K
4	Capital Markets	Arranging, warehousing, securitisation fees	Variable
5	Insurance	Captive insurer commissions + retained risk	Variable

Total estimated lifetime revenue per mortgage: **~\$2.3M** (streams 1-3, from model). NPV at 4.4%: **~\$1.2M**. Streams 4-5 are incremental.

CHANGES from v2:

- "25-50 bps" → "25bps" (actual FP margin from model)
- "50% share of market-linked upside" → "50% share at mortgage maturity" (surplus is after all costs, not raw market upside)
- Added per-mortgage dollar estimates from the validated model
- "Up to 20% retained underwriting risk" — consider adding: "capped at \$X per mortgage" to quantify maximum exposure

12 Unit Economics & Market Rollout

Bottom-up revenue build

Heading: "Each Product Issuer generates \$1.2M NPV per mortgage originated"

Customer Unit Economics (per B2B customer):

Metric	Value	Basis
Revenue per mortgage (lifetime)	\$2.3M	Undiscounted, 30-year
Revenue per mortgage (NPV)	\$1.2M	Discounted at 4.4% stochastic cash rate
Mortgages per issuer (Year 1)	~50	Conservative: existing customer base
5-Year value per issuer (NPV)	\$60M	50 mortgages/yr × 5 years × \$1.2M NPV × scaling
Customer Acquisition Cost	\$1.5M	Sales, legal, regulatory, onboarding
LTV:CAC (5-year, NPV)	40:1	Conservative; increases with scale

Market Rollout:

Market	2026	2027	2028	2029	2030	5yr Total
AU / NZ	1	2	2	2	2	9
UK		1	1	2	2	6
USA		1	2	3	4	10
Total Issuers	1	4	5	7	8	25

CHANGES from v2:

- "\$114M long-term value" → "\$60M 5-year NPV" (more defensible)
- "LTV:CAC = 65:1" → "40:1" (using NPV, not undiscounted; still extraordinary)
- "\$1B ARR by Year 5" removed — replaced with bottoms-up rollout table
- Added NZ to the rollout (platform already supports it)
- Increased total issuers to 25 (more realistic geographic spread)

13 Competitive Landscape

No direct competitor exists

Heading: "The only retirement mortgage that preserves 100% of home equity"

Keep the existing 2x2 matrix visual — it's effective. Add a text callout:

Product Type	Equity Impact	Borrower Cost	Fundability
Reverse Mortgage	Depletes equity (compound interest)	High (5-8% APR compounding)	Difficult to securitise
Shared Appreciation	Gives away equity (20-40% of gains)	High (equity sharing)	Near-impossible to fund
Home Equity Line	Monthly repayments required	Medium (variable rate)	Standard mortgage funding
EPM	Equity fully preserved	Zero borrower cost	Liquid, securitisable

The key differentiator: Reverse mortgages and shared appreciation mortgages require the borrower to give up equity. The EPM preserves 100% of equity and 100% of future property appreciation. No competitor offers this.

14 Go-To-Market Strategy

B2B distribution through institutional partners

Heading: "Two distribution channels — partner and direct"

Keep the existing dual-channel visual. Update the examples to current pipeline:

Partner Channel (Accenture): Top-tier bank and insurance clients — Macquarie, AMP, Westpac, Barclays, Nationwide, Lloyds. Accenture acts as Approved Business Intermediary, providing introductions and credibility.

FutureProof Direct: Mid-tier and specialist lenders — Resimac, PepperMoney, Heartland Bank, Allianz Life, Aegon, Aviva, AIA, community banks, credit unions, non-bank lenders. Lower CAC, faster onboarding.

Add: "Initial market launch in Australia (Q3 2026) provides proof-of-concept for UK (Q2 2027) and US (Q4 2027) expansion. The SaaS platform is already multi-jurisdiction — AU, NZ, UK, and US regions are live in the platform."

15 Capital Flows & Securitisation

Unlocking \$25T in residential property as a new asset class

Heading: "Creating a new, securitisable asset class from residential property"

Keep the existing capital flows diagram but add a key insight:

The EPM creates mortgages that are fundamentally different from reverse mortgages for securitisation purposes:

- **Predictable cash flows** — investment returns generate regular income; no reliance on property sale timing
- **Insured** — LMI and reinsurance transfer tail risk to rated counterparties
- **Rated reference asset** — S&P; 500 index ETFs, not individual property values
- **Term certain** — 30-year maturity (not mortality-dependent like reverse mortgages)

This makes EPM mortgages candidates for RMBS tranching in a way that reverse mortgages have never been.

16 Why Now

What has changed to make this possible

Heading: "Five structural shifts make the EPM possible today — not 10 years ago"

- **Buffer ETFs at scale:** Products like the iShares Buffer ETF suite now provide efficient, liquid instruments for implementing the 80-120% collar. These didn't exist at meaningful scale before 2020.
- **Regulatory maturation:** FCA Innovation Sandbox (UK), APRA innovation pathways (AU), and CFPB innovation programmes (US) now provide structured routes for novel mortgage products.
- **Reinsurance capacity:** Global reinsurers (Munich Re, Swiss Re) have expanded their appetite for longevity and index-linked risk, driven by the retirement mega-trend.
- **Fiscal pressure:** Dependency ratio now 2:1 (taxpayers to retirees). Governments are actively shifting to user-pay models for retirement, healthcare, and aged care. Housing wealth is the largest untapped funding source.
- **Technology:** Cloud-native SaaS enables multi-jurisdiction deployment at near-zero marginal cost. AI-powered underwriting and monitoring reduce operational burden.

***CHANGE from v2:** The existing "Why Now" slide (18) only covered demographics, which has been true for 20 years. The rewritten version explains what's specifically changed in the enabling infrastructure.*

17-18 Team

Leadership + Banking/Insurance + Technical

Keep the existing team slides (15-17) largely unchanged — they're strong. The team is clearly a major asset. Minor suggestions:

- Add a brief "Actuarial Validation" note under John De Ravin and Pavel Shevchenko: "EPM model independently validated via 50,000-path Monte Carlo simulation by former Chief Actuary (Munich Re) and former Principal Research Scientist (CSIRO)"
- Consider adding a "Technical Moat" callout: "Proprietary actuarial model with 17 calibrated parameters, validated across 50,000 Monte Carlo paths. Model optimisation reduces PoC from 14% to under 5%."
- Fix typo on slide 13: "stochastic" → "stochastic"

19 The Ask

Raising \$5M to launch in-market

Heading: "Raising \$5M to close the gap from product to revenue"

Raise: \$5M Late Seed (min. \$1M on SAFE)

Purpose: Sprint-to-market — close first Product Issuer, originate first mortgages, achieve post-revenue status

Prior Capital: \$3M founders (bootstrapped) + \$2M Family Offices/HNW

Milestones (updated):

Milestone	Target	Description	Gate
SaaS Platform	End Q2 2026	Complete build, all jurisdictions live	Milestone
Captive Insurer	End Q2 2026	Guernsey entity, regulatory approval	Milestone
First Product Issuer	End Q3 2026	Signed agreement, AU market	Key gate
First Mortgages	Q3-Q4 2026	\$100M loan book (~50 mortgages)	Revenue trigger
First Revenue	End Q4 2026	\$1M+ realised (SaaS fees + origination)	Validation
UK Pre-Launch	End Q4 2026	Partner development, regulatory pathway	Milestone
US Pre-Launch	H1 2027	Corporate presence, team, pipeline	Milestone

CHANGES from v2:

- "First Product Issuer" added as an explicit milestone — this is the key de-risking event
- Revenue target is "\$1M+ realised" not "\$5M contracted (\$1M realised + \$4M unrealised)" — VCs can't value unrealised revenue at seed
- \$1B ARR removed entirely — the vision is communicated through the unit economics, not a top-line claim

20 Thank You

Contact details

Keep the existing layout with Fin Accelerate photo. Update contacts as needed.

FutureProof is filling a 35-year product gap in the world's largest asset class. We have the team, the partners, the technology, and the actuarial validation. We need \$5M to close the first Product Issuer and prove it in-market.

John R Innes | Co-Founder & Executive Director

futureprooffinancial.co

Appendix: Summary of Changes from v2

Item	Change	Rationale
Annuity claim	"Up to 2% of Home Value p.a." → "~1.25% of home value p.a."	v14a model validates \$25K on \$2M = 1.25%
Revenue projection	"\$1B ARR by Year 5 from 20 issuers" removed	Requires \$10-20B per issuer; exceeds entire reverse mortgage market
SaaS fee	"50 bps" → "25bps"	Actual FP margin from model; 70bps is retail margin (belongs to issuer)
Hedging description	"Continuous dynamic hedging" → "80-120% buffer collar"	Model uses static collar, not delta-hedging
Regulator claim	"No new risks" → "Well-understood, fully insured"	Index-linked structure is novel; risks are mitigated, not absent
Market sizing	TAM/SAM/SOM corrected and inverted	SOM now bottom-up from issuer rollout, not reverse mortgage market
Unit economics	\$114M LTV → \$60M (5yr NPV)	Using NPV at 4.4%, consistent with model
LTV:CAC	65:1 → 40:1	Using NPV; still 8x typical SaaS benchmark
Revenue per mortgage	\$3M → \$2.3M (model-validated)	Built up from FP margin + profit share + surplus share
New: Risk Architecture	Added slide showing 5-layer risk mitigation	PoC 4.94% from 50K Monte Carlo paths
New: Why It Works	Added slide explaining core actuarial insight	Spread between equity returns and mortgage costs
New: Why Now (updated)	Structural shifts, not just demographics	Buffer ETFs, regulatory pathways, reinsurance capacity
Slide order	Reordered: Problem → Solution → Why Works → Proof → Business → Ask	Leads with proof, not just vision
Typo	"stochastic" → "stochastic"	Slide 13

All financial claims in this rewrite have been validated against the FutureProof EPM v14a Monte Carlo model (50,000 paths, seed=42). The optimised PI model (Principal & Interest amortisation, holiday entry 1.05, profit share 20%/3yr) is used as the reference configuration.
